

## INFORMATION REGARDING FITTING PLATES TO SILENCER CASINGS

Jetex end plates are designed to be a secure fit. It is normal that around half or less of the plate edge protrudes from the casing. This is in order to prevent the plates from falling through during assembly, but also to offer a base for welding.

The smooth side faces into the casing.

It is advised to align the lower part of the plate into the casing as shown in Image 1.

Image 1

With your opposing hand, hold the casing and while pushing it down, push the plate into the casing. It may take few times to get the plate to sit as it should; as shown in Image 2.
